

Descendants of James David Graves and Mary Ann Durham of NC & TN (Gen. 535)

Autosomal DNA Testing

(Rev. 12 Oct. 2012)

GRAVES ANCESTRY:

Possibly descended from genealogy 13, 169, or 220 on the GFA website. A male descendant with the Graves surname needs to take a Y-DNA test to determine which ancestry is correct.

Getting more autosomal DNA test results and comparing those results to the ones for the other genealogies will provide additional information and support.

NOTES: This chart shows all lines of descent that have been tested by autosomal DNA testing from both 23andMe (Relative Finder) and FTDNA (Family Finder).

The numbers at the bottom of the bottom blocks are the chromosome number and the starting and ending position (in millions) of the segment on that chromosome that matches another descendant. The letter in parentheses indicates whether the result is from Relative Finder or Family Finder.

The reason for the "no matching data" result is probably that there are too many generations since the common ancestor for a large enough segment of DNA to have been passed on. It is possible that there is a segment of DNA that could be identified if smaller segments are looked at.

If other Graves descendants have segments of chromosomes that they share with other descendants, let us know, and those results will be added to the chart.

KEY:(F) indicates match is from Family Finder, and (R) indicates from Relative Finder.

Red DNA segments are probably from Graves ancestors.
Blue DNA segments may be from common ancestors who are not Graves descendants.
